

Form v2- Feature

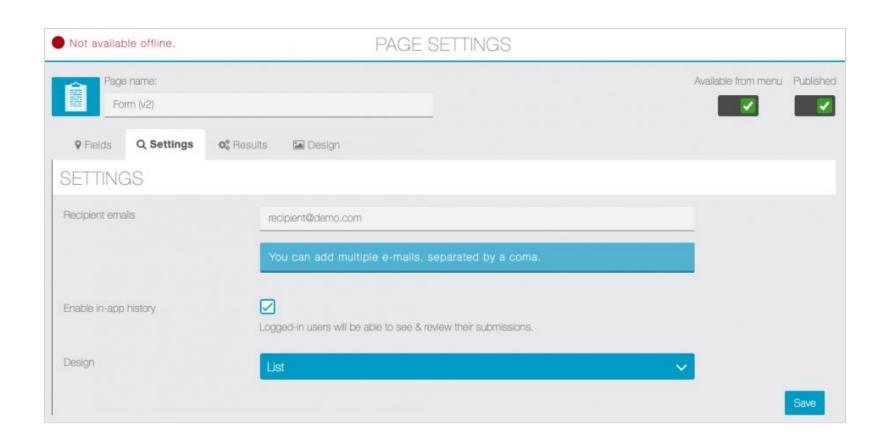

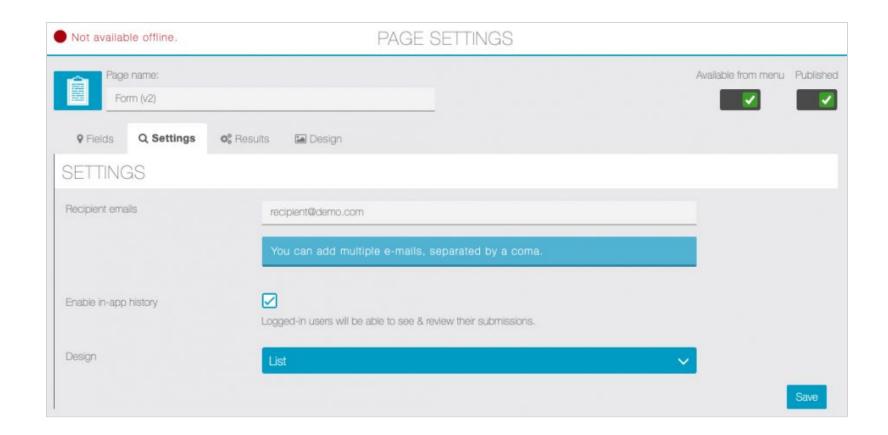

To create a form click on

in the "Add pages" part.

This window will appear:

Setting:

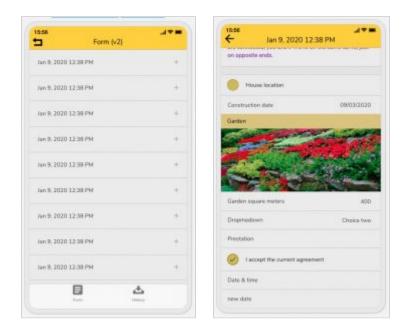

In Recipient emails field, you can enter multiple recipients, separate e-mails with a coma:

mail1@domain.com,mail2@domain.com,mail3@domain.com

Enable in-app-history: with the history, logged-in users will be able to see (read-only) their submissions, sorted by date.

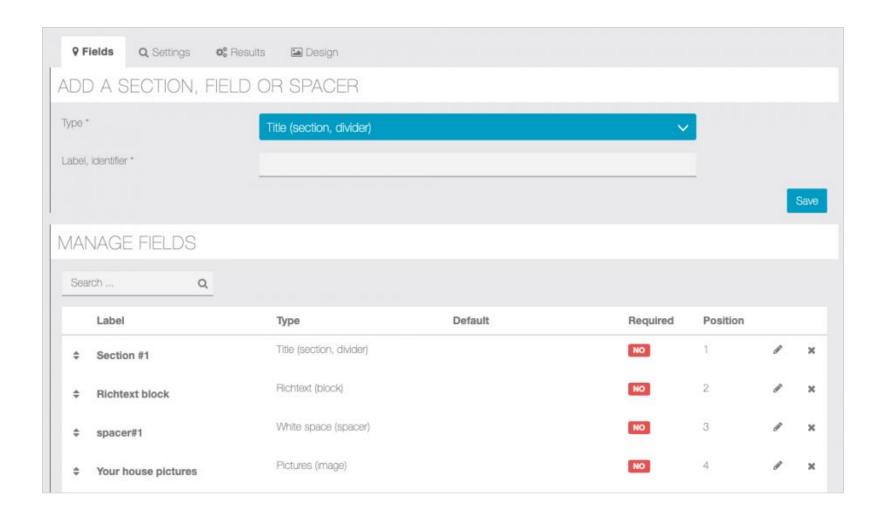

Note: the history is only available for logged-in users and when the option is enabled, all submissions made when the setting is off are not saved in the user history, however they are saved in the admin results tab & sent by e-mail when configured

Design: choose between list & card to fit your application design.

Fields

To build your form, you will have to choose from all the field types available

Fields are grouped in two sections: Formatting elements & Input elements

Let's check below how each field work:

Formatting elements:

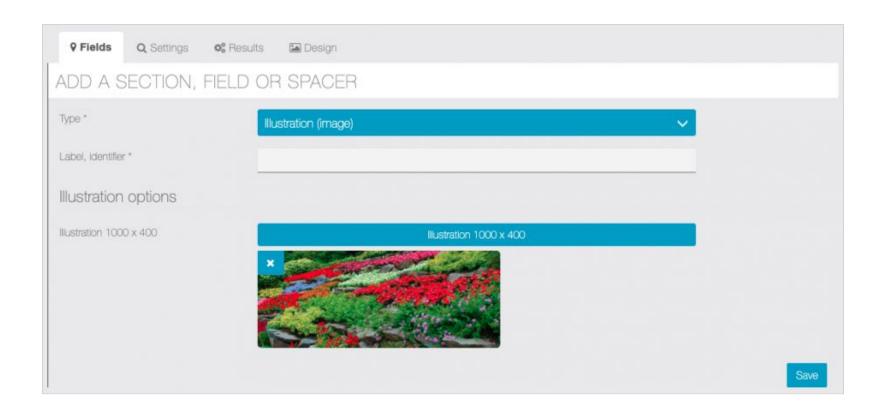

Title (section, divider): use it to create contrasting title/label elements

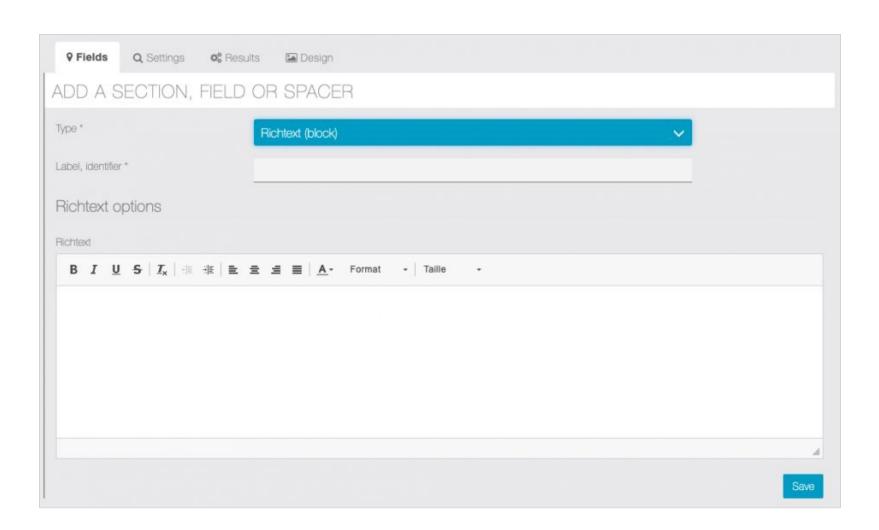

White space (spacer): adds a 20px space between any other field

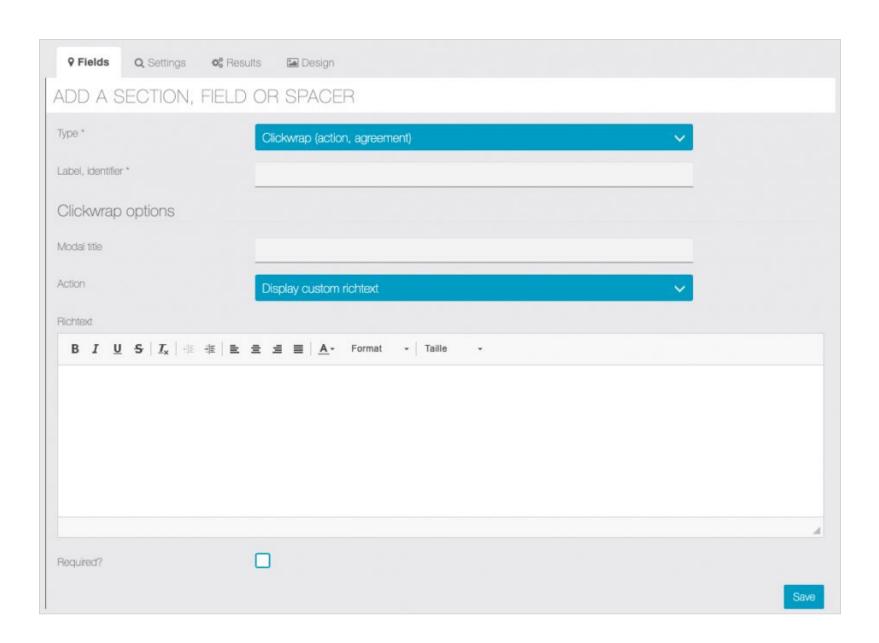

Illustration: adds an image in the form

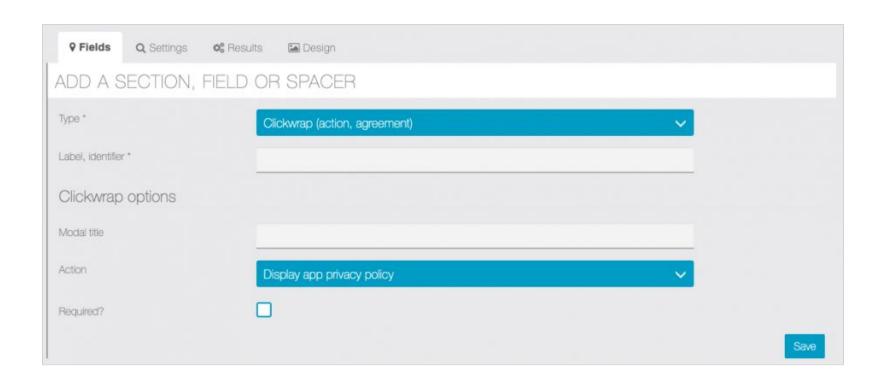

Richtext (block): creates a richtext (wysiwyg) block anywhere in the form

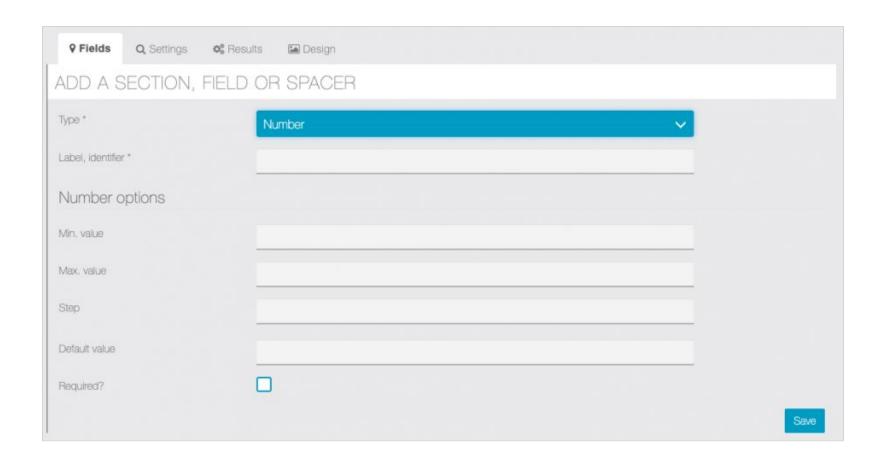

Clickwrap (action, agreement): adds a checkbox which when clicked opens a modal with either a custom agreement, or the application privacy policy

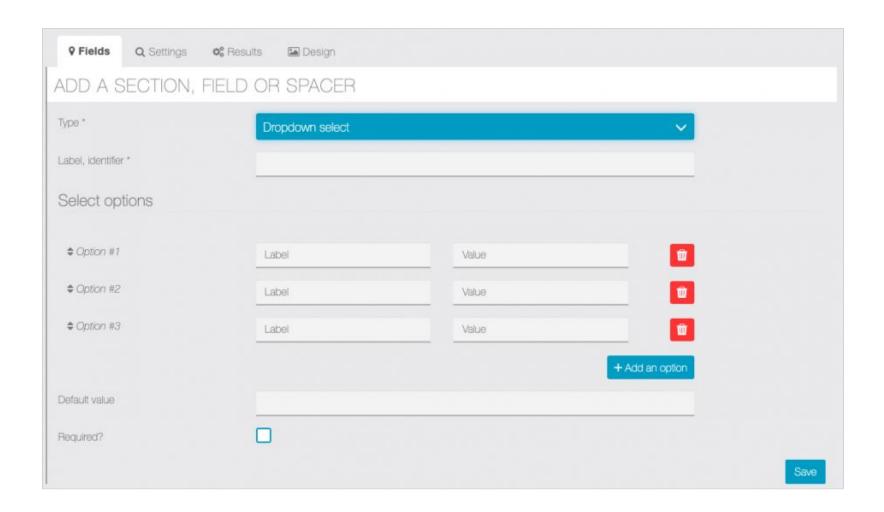

Input elements

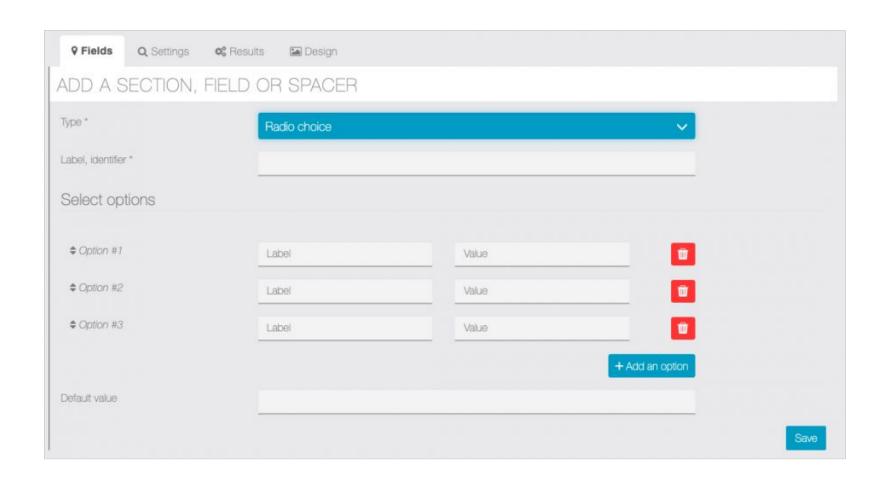

Number: adds a number input with options, minimum, maximum & step increment

Dropdown select: adds a select element with multiple options

Radio choice: adds a radio input choice

Checkbox: adds a simple checkbox element

Password: adds a password text element, input text is not readable

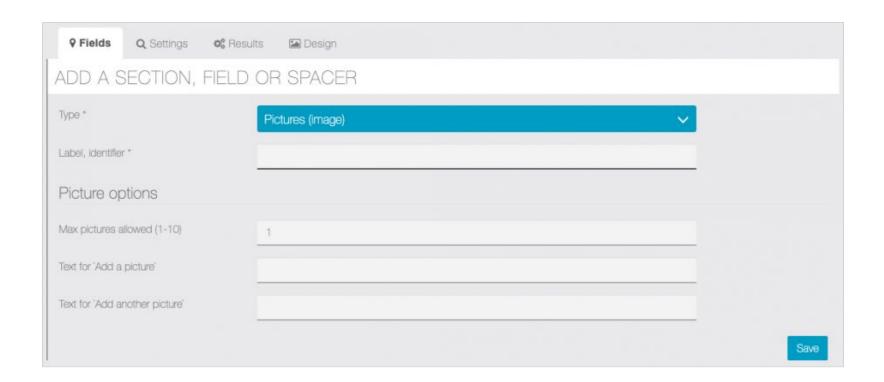

Text input: a single line text input

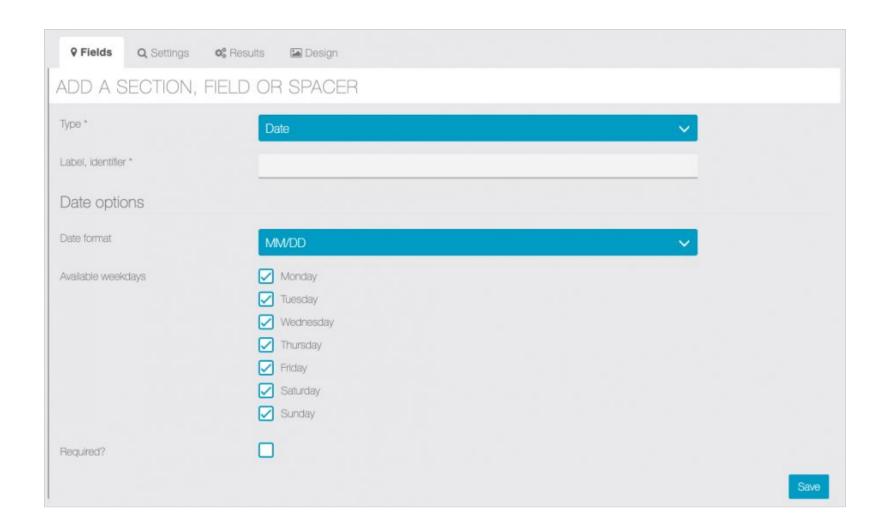

Textarea: a multiline text input

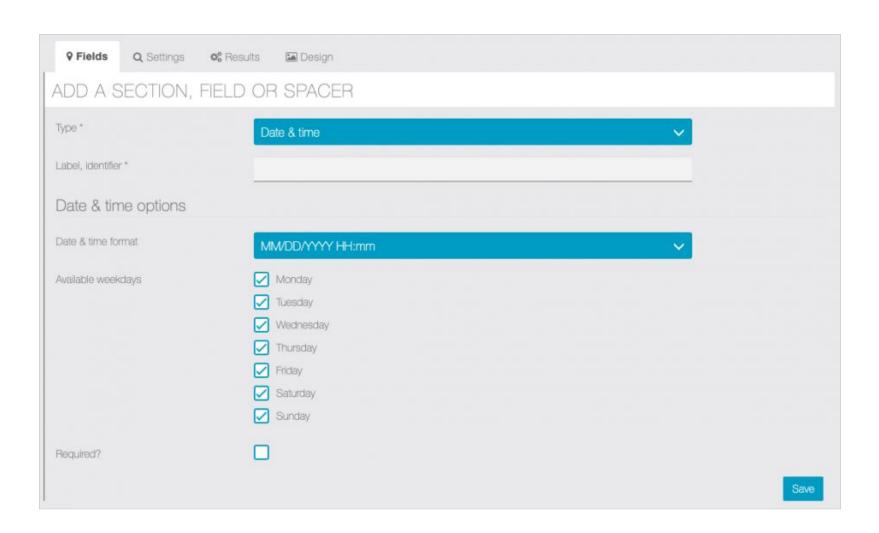

Pictures (images): allows user to send up to 10 images, the limit can be configured individually for each picture input, as long as the placeholder texts

Date: simple date field, with format options & weekdays restriction

Date & time: simple date & time field, with format options & weekdays restriction

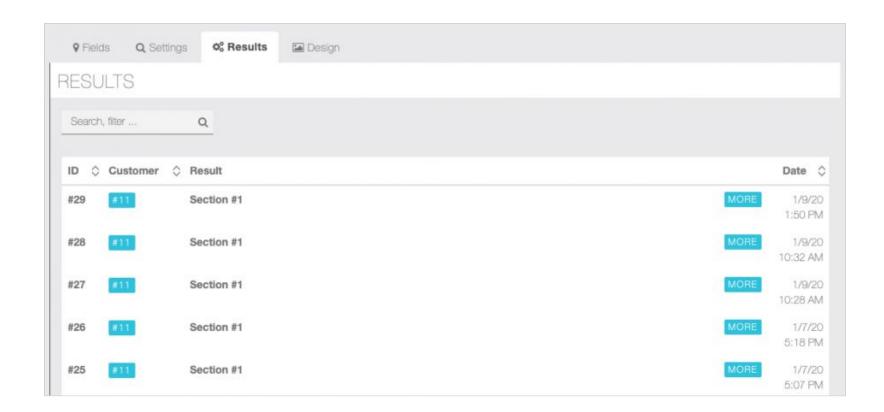

Geolocation (GPS, georeverse): a clickwrap action, when the users check the box, it's location is saved and georeversed (the georeverse api requires a google maps api key)

Results

In Results tab you can see the answers of the users.

You can also export the results as .CSV file and choose to exclude anonymous results and/or keep only last entry for identified customer.
